SPRING RUNOFF POTENTIAL AS OF APRIL 1, 2013

Water Security Agency

Above normal precipitation prior to runoff and/or a faster than typical rate of melt will result in significantly higher runoff.

In many areas conditions vary considerably over short distances.

Projected runoff is based on sparse, variable and often conflicting snow accumulation estimates.

Runoff boundaries should be considered approximate.

LEGEND

POTENTIAL RUNOFF

- Near Normal
 Flow primarily in natural channel (≈ 1:2 yr event)
- Above Normal
 Natural channel exceeded in some reaches (≈ 1:5 yr event)
- Well Above Normal
 Significant out of channel flow (≈ 1:10 yr event
- Very High
 Flooding is likely (≥ 1:25 yr event)
- Runoff Nearing Completion
- Runoff Underway

WSA prepares maps with varying degrees of accuracy and completeness dependant on the circumstances and available data.
WSA makes no representation that this map will be sufficient for all uses. The user is advised to confirm the information contained herein in the event that precision and currency of data are required.
